

Socio-economic evaluation of development projects: A methodological contribution

Student: Thomaz Fagá

Supervisor: Dr. Jorge Cunha

In the context of public investments, focussed on socioeconomic development projects, it is not uncommon to find gaps regarding the verification of physical and financial deviations between the values forecasted at the project proposal phase and the actual values inherent to the execution phase, and also in the measurement of the real benefits achieved.

The data/results would be estimated at the presentation phase of the project proposal (*ex ante* analysis) and then compared with the results achieved at the end of the project (*ex post* analysis).
